Introduction

- I have some preliminary results for FSRs responses.
- I first generated a two-way table that tallies the number of occurrences of tone by phonation.
- From this we see a gap in the possible combinations of tone and phonation, which bears some striking similarities to San Lucas Quiaviní Zapotec.

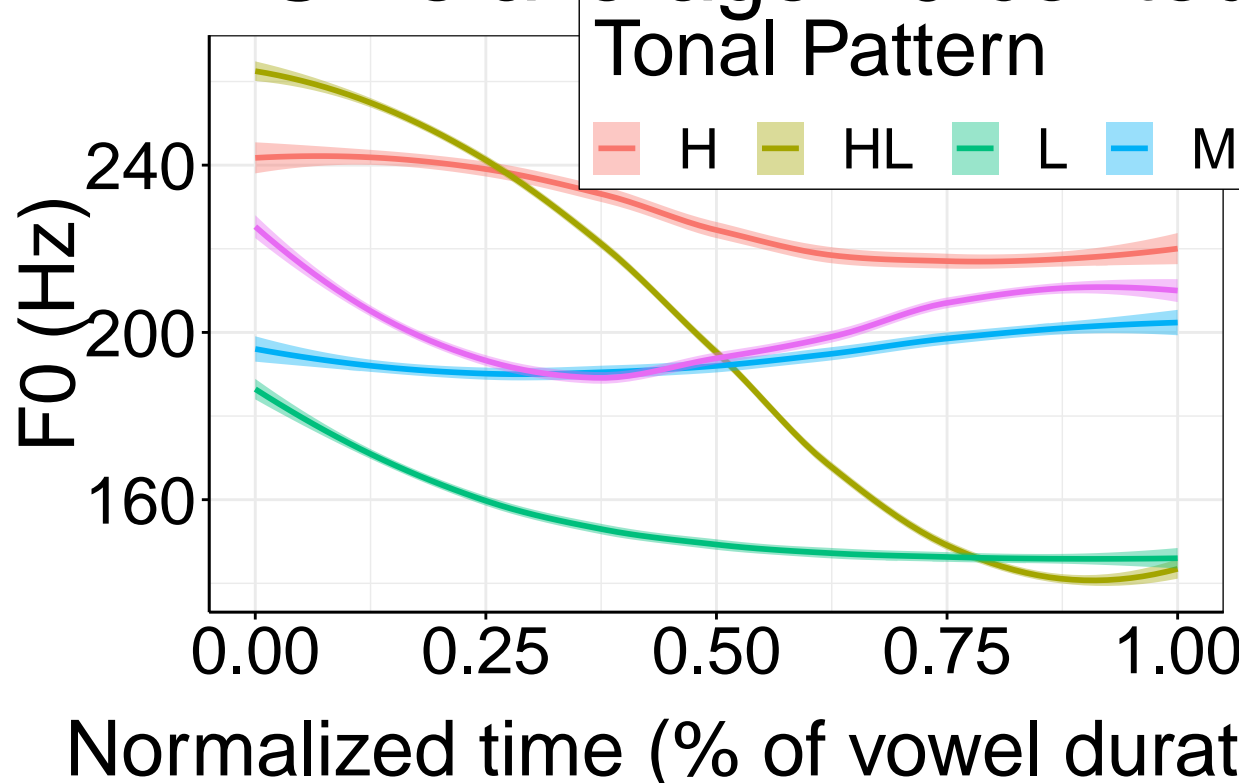

```
##
##      Modal Breathy Checked Laryngealized
##  H   3778         0    2013           1673
##  HL  6076         0    1732           3865
##  L   9209       4186    2725           1336
##  M   2522         0     503            320
##  MH   711        920         0          1043
```

- This shows that SLZ only allows ## Tonal plots

You can also embed plots, for example:

```
## `geom_smooth()` using formula 'y ~ x'
```

FSR's average F0 contour
